# City Hospital Infection Control Guide

## Hand Hygiene

Hand hygiene is performed at the five moments: before touching a patient, before a clean procedure, after body fluid exposure, after touching a patient and after touching patient surroundings.

Alcohol hand rub should be applied for 20 seconds until hands are dry.

Soap and water are required when hands are visibly dirty or after caring for a patient with diarrhoea.

## Protective Equipment

Gloves are changed between patients and hand hygiene is done after removing them.

An N95 respirator is worn for airborne precautions, such as suspected tuberculosis.

Isolation gowns are removed before leaving the patient room.

## Sharps and Waste

Needles are never recapped and go straight into a sharps container.

A sharps container is closed and replaced when it is three quarters full.

Clinical waste goes in the yellow bag and general waste in the black bag.
