TechCo Developer Onboarding Guide

Your First Week

Every new developer is paired with a mentor for the first 30 days.

On your first day you receive a laptop, a GitHub account and access to Slack.

You must complete the security training within 5 working days of joining.

Your first task is a small bug fix so you learn the release process end to end.

Development Environment

All services run locally with Docker Compose using a single command: make up.

The main web app is written in React with TypeScript, and the API uses Node.js with Express.

We store data in PostgreSQL, and every developer has a local copy seeded with fake data.

Never connect your local environment to the production database.

Working Hours and Communication

Core hours are from 10:00 to 15:00, when everyone should be reachable on Slack.

The daily stand-up meeting lasts 15 minutes and starts at 10:15.

Questions about a task go in the project channel, not in private messages, so the whole team can learn.

If you are blocked for more than 2 hours, ask your mentor for help.

Security Basics

Passwords and API keys must never be committed to Git; store them in the team password manager.

Two-factor authentication is required on GitHub, Slack and the cloud console.

Report any suspected security incident to the security channel within 1 hour of noticing it.
